Sem III 2021-22

Lab Number:	8
Student Name:	ABHISHEK MANIK WAGHMARE
Roll No:	01

Title:

- 1. To perform Multilevel Inheritance in JAVA. Create a Person class representing name, age and address. Inherit person class to employee class with emp ID and salary factor. Inherit the Employee class to programmer class with technical skills and hike attributes. Implement valid methods to input the details from the user in the main method and display for 3 programmers.
- 2. To perform Hierarchical Inheritance in JAVA. Create an Employee class with attributes EmpID and EmpSalary. Also create necessary methods/constructors to accept these values from the user. Create classes permenantEmployee and TemporaryEmployee which will be derived classes of Employee. Mention hike attribute in these derived classes and calculate the total salary using generate_salary() method for respective types of employees. Objects of the derived classes should be created and salaries for the permanent and temporary employees should be calculated and displayed on the screen.

Learning Objective:

- Students will be able to perform multilevel inheritance using JAVA.
- Students will be able to perform hierarchical inheritance using JAVA

Learning Outcome:

• To understand how to use the private members using friend function and friend class.

Course Outcome:

ECL304.2	Comprehend building blocks of OOPs language, inheritance, package and	
	interfaces.	

Theory:

- Explain in details about various inheritance types supported in JAVA
 - 1. <u>Single Inheritance</u>: When a class inherits another class, it is known as a single inheritance.
 - 2. <u>Multiple Inheritance</u>: It refers to the concept of one class extending (Or inherits) more than one base class.

Faculty: Ms. Deepali Kayande

- 3. <u>Multilevel inheritance</u> refers to a mechanism in OO technology where one can inherit from a derived class, thereby making this derived class the base class for the new class.
- 4. <u>Hierarchical Inheritance</u>: In such kind of inheritance one class is inherited by many sub classes.
- 5. <u>Hybrid inheritance</u> is a combination of single and multiple inheritance. A hybrid inheritance can be achieved in the java in a same way as multiple inheritance can be!! Using interfaces.

Algorith 1 – Create a parent class person and initialize its data members and take input of name, age and address. m 1: 2- Create the derived class of person class - employee class to take input of emp id and salaryfactor. 3- Create the derived class of person class - programmer class to take input of hike and technical skills. 4 – Create the Main class to call the class functionalities and display the results. **Program** import java.util.*; class Person { 1: String name; int age; String address; public Person() { name = ""; age = 0;address = ""; void getdata() { Scanner s = new Scanner(System.in); System.out.print("enter name: "); name = s.nextLine(); System.out.println(); System.out.print("enter age: "); age = s.nextInt(); System.out.println(); System.out.print("enter address: "); s.nextLine(); address = s.nextLine(); System.out.println(); void putdata() { System.out.println("name is: " + name); System.out.println(); System.out.println("age is::" + age); System.out.println(); System.out.println("address is: " + address); System.out.println();

Faculty: Ms. Deepali Kayande

```
class employee extends Person {
  int emp_id;
  int salary_factor;
  public employee() {
    emp_id = 0;
    salary factor = 0;
  void getdetails() {
    Scanner s = new Scanner(System.in);
    System.out.print("enter employee id: ");
    emp_id = s.nextInt();
    System.out.println();
    System.out.print("enter Salary Factor: ");
    salary factor = s.nextInt();
    System.out.println();
  void putdetails() {
    System.out.println("employee id is ::" + emp_id);
    System.out.println();
    System.out.println("Salary Factor is::" +
         salary_factor);
    System.out.println();
  }
class programmer extends employee {
  int hike;
  String technical skills = "";
  public programmer() {
    hike = 0;
    technical skills = "";
  }
  void getd() {
    Scanner s = new Scanner(System.in);
    System.out.print("enter hike: ");
    hike = s.nextInt();
    System.out.println();
    System.out.print("enter technical skills: ");
    s.nextLine();
    technical_skills = s.next();
    System.out.println();
  void putd() {
    System.out.println("hike is ::" + hike);
    System.out.println();
    System.out.println("techincal skills is::" +
         technical_skills);
    System.out.println();
```

```
}
            public class Employee {
              public static void main(String[] args) {
                programmer r[] = new programmer[4];
                r[0] = new programmer();
                r[1] = new programmer();
                r[2] = new programmer();
                for (int i = 0; i < 3; i++) {
                  System.out.println("Enter details of employee" + (i+1));
                      r[i].getdata();
                  r[i].getdetails();
                  r[i].getd();
                  r[i].putdata();
                  r[i].putdetails();
                  r[i].putd();
                }
              }
Output
              Enter details of employee1
Screensh
              enter name: Abhishek
ot 1:
              enter age: 19
              enter address: Bhandup
              enter employee id: 12
              enter Salary Factor: 33
              enter hike: 999
              enter technical skills: java
              name is: Abhishek
              age is::19
              address is: Bhandup
              employee id is ::12
```

```
Salary Factor is::33
hike is ::999
techincal skills is::java
Enter details of employee2
enter name:
Enter details of employee2
enter name: Jusmit
enter age: 19
enter address: Panvel
enter employee id: 2
enter Salary Factor: 8
age is::19
address is: Panvel
employee id is ::2
```

```
Salary Factor is::8

hike is ::987

techincal skills is::Python

Enter details of employee3
enter name: Ravi

enter age: 20

enter address: Sakinaka

enter employee id: 3

enter Salary Factor: 10

enter hike: 1000

enter technical skills: C++
```

```
name is: Ravi

age is::20

address is: Sakinaka

employee id is ::3

Salary Factor is::10

hike is ::1000

techincal skills is::C++

Process finished with exit code 0
```

Algorithm 2:	 Creating the parent class employee and initialize its data members. (Empld ,EmpSalary) and a basic function get details() to print the details. Create 2 child class permanent employee and temporary employee that inherit employee class publically. In this classes , create generate salary() that return the employee salary + hike in their salary 4. In main function, Create the object of derived class and print their respective details.
Program 2:	<pre>import java.util.*; class Employee { Scanner s=new Scanner(System.in); int emp_id; int emp_salary; Employee() { System.out.println("enter empid::"); emp_id=s.nextInt();</pre>

Faculty: Ms. Deepali Kayande

```
System.out.println("enter empsalary::");
    emp_salary=s.nextInt();
  void getDetails()
    System.out.println("EmployeeID is ::");
    System.out.println("EmployeeSalary is ::");
  }
}
class permanant Employee extends Employee
    int hike;
    permanant_Employee(intincrement)
    hike = increment;
    void getDetails()
      System.out.println("EmployeeID is ::" + emp_id);
      System.out.println("Employee total salary is ::" + generate_salary());
    }
    int generate_salary()
    return (emp_salary + hike);
    }
class temporary_Employee extends Employee
  int hike;
  temporary_Employee( int increment)
    hike = increment;
  void getDetails()
  System.out.println("EmployeeID is :: " + emp_id);
  System.out.println("Employee total salary is :: " + generate_salary());
```

```
int generate_salary()
                      return (emp_salary + hike);
                    }
                   }
                   public class Main {
                     public static void main(String[] args) {
                     permanant_Employee p = new permanant_Employee(3200);
                     p.getDetails();
                    temporary_Employee t = new temporary_Employee(1600);
                    t.getDetails();
                    }
Output Screenshot
                    enter empid::
2:
                    enter empsalary::
                    EmployeeID is ::1
                    Employee total salary is ::23200
                    enter empid::
                    enter empsalary::
                    EmployeeID is ::2
                    Employee total salary is ::26600
                    Process finished with exit code 0
```
